ABSTRACT

The role of the dog as a definitive host for a number of zoonotic parasites has been recognized as a significant public health problem especially stray dog population. In this population, poor levels of hygiene and overcrowding, together with the lack of veterinary attention and zoonotic awareness, exacerbates the risk of disease infection. A public service was undertaken on Friday 16th September 2005 in Sanur beach to control the dog parasitic zoonoses. About 30 stray dogs and 31 domesticated dogs were treated with anthelmintic to control the helminth infections. All of stray dogs were clinically in poor condition.

Key words: dog, zoonoses
