

ABSTRACT

The development of industry, agricultural sector, and other productive sector has to be increased and aimed to give a maximum economic growth. The productivity of agricultural sector has to be increased continuously, in order to increase the income and society welfare. In the coffee farming, especially in harvest and post harvest activities done by woman labor. Therefore it is to be considered to analyse their productivity.

The objective of this study is find out (1) the productivity of woman labor in harvest and post harvest activities, and (2) the factors influential the activities.

The study was conducted in The Village of Peninjoan. The District of Bangli. The location of study was chosen purposively. The number of sample is 30 which taken purposively. Collected data was analysed descriptively as well as using multiple linear regression (SPSS).

The result of this study, found that (1) the productivity of woman labor in harvest and post harvest of coffee plant was Rp.1,857.74 for hour, labor utilization average was 173.76 hour/season, and wage was Rp 323,533.00/season, and (2) the influence factors to the productivity of woman labor in harvest and post harvest of coffee plant are the experience of farmers, labor utilization, wage, and age.

It is suggested that the wages of woman and man labor should be equal, so that there is no biased.
